

Step 1. Create a feature text file.

Here one creates a list with the density raster maps of the species to be included in the prioritization.

The text file is created in a spreadsheet fashion.

The first column is going to be the “weight” for each species. If all species have 1.0 then are weighted equally. The second column “filename” corresponds to the density maps path.

```
"weight" "filename"
1.0 C:/Angela/BAM_project/Zonation/EHJV/Inputs/birdRasterFiles/pred-BANS-CAN-Mean.tif
1.0 C:/Angela/BAM_project/Zonation/EHJV/Inputs/birdRasterFiles/pred-BOCH-CAN-Mean.tif
```

To see the different parameter accepted for the feature text file see the Zonation 5 manual.
